Sickle cell

# What is Sickle cell?

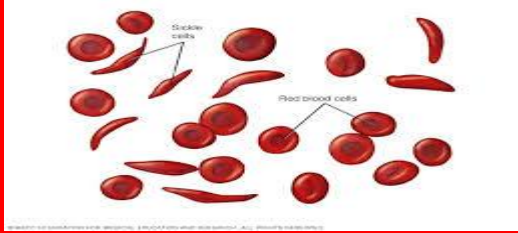

Help us

MakeAGIF.com

Sickle cell anemia is an inherited red blood cell disorder in which there aren't enough healthy red blood cells to carry oxygen throughout your body. These cells look a lot like deformed bannas that is why the shape helps clog up the veins.

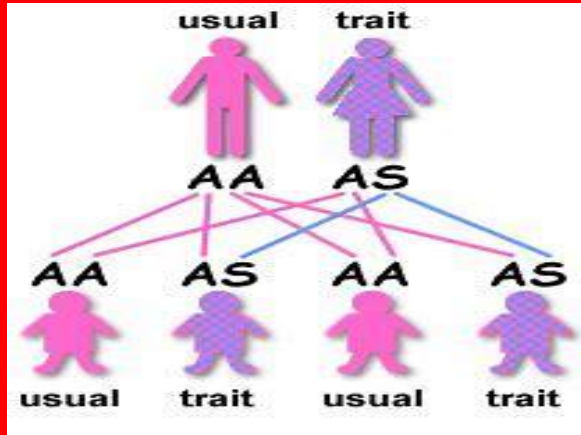

Please donate to this cause  
5 dollars can make a big  
difference. Please go to:  
<https://www.sicklecelldisease.org/general-donations/>

Let's learn about sickle cell.

*Sickle cell disease is the most common inherited blood disorder.*

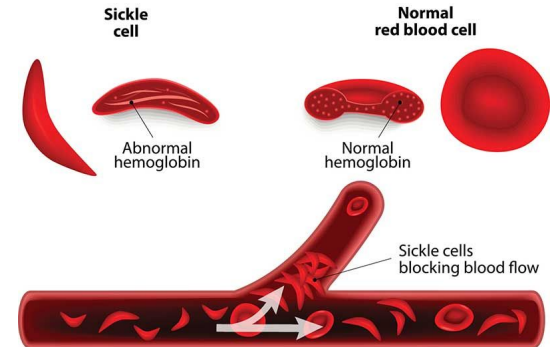

*To be born with sickle cell disease, a child has to inherit a copy of the sickle cell gene from both their parents. This usually happens when both parents are "carriers" of the sickle cell gene, also known as having the sickle cell trait.*

**Ways You Can Help Those  
With Sickle Cell**

**(Bottom Image)**

Let's talk about sickle cell anemia. Every 1 in 500 African Americans and every 1 in 1000 to 1400 Hispanic Americans. People do not have much concern for the rare disease. It causes your blood cells to be misshaped, and clog your arteries, leading to pain, fatigue, and low oxygen in the body.

Let's spread awareness of the disease by spreading the word and donating here:  
[//www.sicklecelldisease.org/general-donations/](http://www.sicklecelldisease.org/general-donations/) Thank you.

# What is sickle cell anemia

Sickle cell anemia is a blood disease that causes your blood to form a crescent shape. It affects people because both of their parents had the gene. This disease causes your blood to clot and wherever it clots it starts to hurt real bad, some people would rather die than deal with the pain. But the worst thing is that hospitals think that people are faking so they can get drugs.
